Product Recap

LLM Gateway

LLM Gateway Recap

LLM Gateway efficiently connects businesses with advanced AI language models, enabling streamlined data processing and insightful analytics for improved decision-making. It optimizes data interactions to enhance overall enterprise intelligence.

Designed for integration, LLM Gateway offers scalable solutions tailored to dynamic environments, ensuring robust performance. Its comprehensive suite of tools provides seamless AI integration, empowering users to leverage linguistic capabilities for targeted applications. With a focus on agility, LLM Gateway fosters a responsive interface that aligns with strategic data utilization goals. Its architecture supports efficient data flow, enhancing analytical precision without overwhelming infrastructure.

What are the key features of LLM Gateway?

- **AI Model Integration:** Facilitates seamless incorporation of AI models for enhanced data handling capabilities.
- **Scalable Architecture:** Adapts to varying workload demands, ensuring optimal resource utilization.
- **Real-Time Analytics:** Provides immediate insights for strategic decision-making.
- **User-Friendly Interface:** Simplified interaction with AI tools for increased productivity.

What benefits should users evaluate in LLM Gateway?

- **Enhanced Data Processing:** Increases efficiency by automating routine tasks.
- **Cost Efficiency:** Reduces expenses with optimized resource allocation.
- **Improved Decision-Making:** Supports strategic choices through real-time analytics.
- **Scalability:** Ensures long-term growth with adaptability to business changes.

Industries like finance and healthcare implement LLM Gateway to harness advanced data analytics, enhancing operations and decision-making. In finance, it aids in fraud detection and risk management, while healthcare benefits from improved patient data handling and diagnostics, showcasing its versatile applicability.

Valuable Features

Excerpts from real customer reviews on PeerSpot:

“Since adopting LLM Gateway, the complexity of our projects has decreased, the security concerns have lessened, and I estimate it has saved us around 20–30% of our time.”

Akashkhurana Hirana

Senior Software Engineer 2 at Porch

“We have seen a positive return on investment, reducing the time required to integrate new AI models by around 40 to 50 percent, cutting troubleshooting time by about 30 percent through centralized logging and monitoring, and improving service availability with automatic failover, which has reduced operational overhead and allowed the team to focus more on delivering new features rather than maintaining integrations, resulting in a clear ROI.”

Dhanesan Sridhar

Decision Scientist 3 at Mu Sigma Inc.

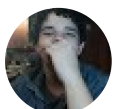

- ✓ “Together, we would estimate a twenty to twenty-five percent lift in engineering productivity on AI work, and from a business angle, new AI capabilities reach production about twenty-five to thirty percent faster because the plumbing is already in place.”

Shravan Revanna

Software Engineer at klydo.in

- ✓ “LLM Gateway is a very efficient solution for what it proposes and I believe it is a solid option if you want to use something that is self-hosted and you can customize extensively.”

Guilherme Ferreira Mury

Senior Penetration Tester at a wholesaler/distributor with 501-1,000 employees

- ✓ “What I appreciate most about LLM Gateway is that there is no need to maintain multiple keys.”

Validated user

Software Engineer at a consultancy with 11-50 employees

- ✓ “The best features LLM Gateway offers include cost optimization, multi-modal support, and authentication and authorization all in one place.”

Validated user

Senior Architect at a tech vendor with 10,001+ employees

What users had to say about valuable features:

“What I appreciate most about LLM Gateway is that there is no need to maintain multiple keys. It provides one virtual key that I can use to access everything. The spend logs feature has been particularly helpful for my organization to understand the total spending on AI keys from OpenAI, Anthropic, and similar providers. I could also build a comprehensive dashboard to demonstrate to my management..”

Validated user

[Read full review](#) 

Software Engineer at a consultancy with 11-50 employees

“The standout feature for me is the centralized API management. It lets me manage multiple LLM providers through a single interface without changing my application code. I also value the built-in authentication, rate limiting, logging, and monitoring because they simplify operations and improve security. Another feature I find useful is failover and model routing, which keeps the chatbot available by automatically switching to another model if one provider is unavailable.

“What impressed me is how easy it is to manage multiple LLM providers from a single gateway. The centralized logging and monitoring make troubleshooting much easier, and the failover capabilities improve reliability in production. One feature I would like to see is more advanced analytics, such as a detailed usage dashboard, cost tracking per model, and AI-powered performance recommendations..”

Dhanesan Sridhar

[Read full review](#) 

Decision Scientist 3 at Mu Sigma Inc.

“The single sign-on functionality being locked out for the enterprise plan is a significant downside, but it is something that can be worked around since LLM Gateway is an open-source project. You can fork it and make your own configurations and build your own code based on that project.

“LLM Gateway is very scalable. You can add any provider key you want and generate as many keys as needed. You can create teams and groups of people that will interact with the API key you generate.

“The setup was straightforward. We did not encounter any problems. We found an instance that could fulfill the basic requirements, installed the dependencies, and it was very easy to implement..”

Guilherme Ferreira Mury

Senior Penetration Tester at a wholesaler/distributor with 501-1,000 employees

[Read full review](#) 

“The best features LLM Gateway offers include cost optimization, multi-modal support, and authentication and authorization all in one place. The way the API gateway handles requests is a major advantage.

“The integration capabilities are very simple, and it can be integrated with any open-source tools. We were using Temporal and OpenHands, and integration was quite straightforward. You can create an instance of LLM Gateway on a local machine as well, which is very helpful for developers to work with it, and you can have analytics drawn with the activities.

“LLM Gateway has positively impacted my organization because costs have increased with AI, and as a Solution Architect, I need to consider the cost optimization part. I need to understand how many tokens are being consumed and where we are heading. LLM Gateway gives us analytics on the cost optimization and cost expense, so as an architect, we can understand and perform our cost optimization part based on that information..”

Validated user

Senior Architect at a tech vendor with 10,001+ employees

[Read full review](#) 

“The best features LLM Gateway offers include multi-provider AI access and the ability to access around 200 plus models available in the market. We just need to pass our key and set up this one, and it can access all the available models. Apart from this, it automatically routes the request based on context if we set it in LLM Gateway. Another feature is the automatic failover functionality where if something goes wrong, it redirects the request to another model. LLM Gateway also provides usage analytics with a dashboard where we can check the current usage of each model and see how many requests are going to each model. It persists data for around 30 days, so we can review usage over the last month. LLM Gateway can be self-hosted as well, which is beneficial for large companies with security concerns.

“I find multi-provider access and failover to be the most valuable features day-to-day. Multi-provider access integrates all available models, acting as a router between the application and LLM Gateway. If my application is using four different models, I only need to call LLM Gateway, which manages everything. We also do not need to share sensitive API keys, as the developer can directly call LLM Gateway, which handles everything seamlessly. The failover feature automatically redirects requests if something goes wrong in one model, and it is incredibly easy to configure. It does not take more than a minute to set up.

“One positive impact of LLM Gateway on my organization is reducing security risk. If we give API keys to everyone, they can misuse them outside the organization. However, we no longer share API keys, as users just need to call our LLM Gateway, and the API keys remain secret and contained within our on-premises setup. Security-wise, it has significantly reduced our organization's risk..”

Akashkhurana Hirana

Senior Software Engineer 2 at Porch

[Read full review](#) 

“LLM Gateway quietly becomes part of the default developer workflow; new AI services start with the gateway by default, which means we do not have to relitigate logging, monitoring, or provider switching every single time. It lowers the friction to experiment but keeps things observable and manageable as we scale.

“For us, the best features LLM Gateway offers are centralized observability, multi-provider routing, and resilience. Centralized logs and metrics make debugging and cost tracking far easier. Routing lets us switch or test models without touching application code, and retries plus fallback strategies add resilience when providers experience issues. Additionally, it is valuable having a single place for policy concerns such as rate limits and consistent authentication.

“The feature that has had the biggest impact on my day-to-day work is centralized observability; that is the feature we feel every day. When something is off, latency spikes, cost jumps, or a prompt misbehaves, we check one dashboard and trace it. That beats digging through five services' logs, and it also helps during rollouts because we can see real usage and cost almost immediately. Routing and fallbacks matter, but observability saves us time every single week.

“The features work best as a bundle. Observability tells you what is happening, routing lets you act on it quickly, and resilience keeps user impact low while you fix root cause. It is that combination that makes it feel like infrastructure you can rely on, rather than a loose set of SDK calls.

“LLM Gateway has impacted our organization positively by making us faster and calmer. We are faster because spinning up new AI features does not mean reinventing provider plumbing, and we are calmer because when something goes wrong, we know where to look and we have levers to pull, which reduces fire drills. It also builds confidence to experiment because rollbacks and provider changes feel safer..”

Shravan Revanna

Software Engineer at klydo.in

[Read full review](#) 

Other Solutions Considered

“When I used Qualys, I was using primarily the SaaS product, which was Total AppSec, and I also had previous experience with VMDR. These were the two main products that I was using..”

Guilherme Ferreira Mury

Senior Penetration Tester at a wholesaler/distributor with 501-1,000 employees

[Read full review](#) 

“I have not used anything similar to LLM Gateway before. When I decided to use LLM Gateway, I explored a couple of other options, but I proceeded with this one because I felt it was the best choice among all the alternatives and it was less expensive..”

Validated user

Software Engineer at a consultancy with 11-50 employees

[Read full review](#) 

“Before using LLM Gateway, we integrated directly with individual LLM provider APIs. As we added more models, managing separate integrations, authentication, monitoring, and failover became increasingly complex. We switched to LLM Gateway because it provides centralized API management, consistent security policies, better observability, and easier model routing. This reduces maintenance effort and made our AI infrastructure more scalable and reliable..”

Dhanesan Sridhar

Decision Scientist 3 at Mu Sigma Inc.

[Read full review](#) 

“Before choosing LLM Gateway, we evaluated a few alternatives, including building our own gateway for direct integration with providers such as OpenAI and Anthropic, as well as other AI gateway platforms. We ultimately chose LLM Gateway because of its centralized API management, strong security, governance features, reliable model routing and failover, and comprehensive monitoring. It offered the best balance of functionality, scalability, and ease of management for our requirements..”

Dhanesan Sridhar

Decision Scientist 3 at Mu Sigma Inc.

[Read full review](#) 

“I evaluated other options before choosing LLM Gateway; I looked at a couple of other commercial gateways and debated rolling our own. Direct integrations were the baseline but became hard to manage as use cases multiplied. Building in-house looked flexible, but it would have pulled engineers into long-term platform maintenance. I chose this gateway for the balance of multi-provider support, centralized observability, and ease of integration with our existing AWS stack. It let us standardize quickly without becoming a platform team, which kept our focus on shipping product features rather than running gateway infrastructure..”

Shravan Revanna

Software Engineer at klydo.in

[Read full review](#) 

“LLM Gateway is an open-source and self-hosted solution, while OpenRouter is a SaaS solution. I think they overlap each other in some ways. OpenRouter allows you to bring your own API key, and LLM Gateway also allows you to do so. I think they can complement each other and not only overlap each other, but they have similar functionalities. OpenRouter also has a layer of Guardrails that you can apply, but I am not certain how this works in detail. I have never used OpenRouter extensively and have only reviewed the functionalities and functions they offered. I also know they can handle AI LLM fallbacks when you exhaust a resource from your current plan. LLM Gateway can also do that. I am not certain if they are direct competitors, but I think LLM Gateway is a very efficient solution for what it proposes and I believe it is a solid option if you want to use something that is self-hosted and you can customize extensively. I think OpenRouter does not offer this much personalization..”

Guilherme Ferreira Mury

Senior Penetration Tester at a wholesaler/distributor with 501-1,000 employees

[Read full review](#) 

ROI

Real user quotes about their ROI:

“After using LLM Gateway, we see that our security risks have reduced. In my organization, we do not only look at ROI, but we also consider security threats. Since adopting LLM Gateway, the complexity of our projects has decreased, and the security concerns have lessened. I estimate it has saved us around 20-30% of our time, and around 30% sounds reasonable..”

Akashkhurana Hirana

Senior Software Engineer 2 at Porch

[Read full review](#) 

“We have seen a positive return on investment. While we do not disclose exact financial figures, we have reduced the time required to integrate new AI models by around 40 to 50 percent, cut troubleshooting time by about 30 percent through centralized logging and monitoring, and improved service availability with automatic failover. This efficiency has reduced operational overhead and allowed the team to focus more on delivering new features rather than maintaining integrations, resulting in a clear ROI..”

Dhanesan Sridhar

Decision Scientist 3 at Mu Sigma Inc.

[Read full review](#) 

“I can share specific outcomes or metrics that show the positive impact; we have seen a measurable return, though I would frame these as solid internal estimates rather than formally tracked KPIs. We see roughly thirty to forty percent less development effort on new AI features because teams integrate once with the gateway instead of building custom provider logic each time. Model evaluations are about fifty percent faster since we can switch or compare providers through configuration rather than code changes. On the cost side, centralized observability has helped trim unnecessary LLM spend by around fifteen to twenty percent by surfacing inefficient prompts and duplicate requests. Troubleshooting is also about thirty to forty percent faster because all the signal is in one place. Together, we would estimate a twenty to twenty-five percent lift in engineering productivity on AI work, and from a business angle, new AI capabilities reach production about twenty-five to thirty percent faster because the plumbing is already in place. The return has come more from developer velocity and operational clarity than from direct license savings.

“We have seen a return on investment; I would call these relevant metrics internal estimates more than audited KPIs. We are seeing roughly thirty to forty percent less development effort on new AI features, about fifty percent faster model evaluation cycles, fifteen to twenty percent lower LLM spend from spotting inefficient prompts and shifting to better-fit models, and thirty to forty percent faster troubleshooting thanks to centralized logs. All told, that shows up as maybe a twenty to twenty-five percent productivity lift for engineers working on AI features. We have not reduced headcount because of the gateway, but we have avoided adding operational overhead as AI usage grew, which is where the return feels strongest..”

Shravan Revanna

Software Engineer at klydo.in

[Read full review](#) 

Use Case

“I use LLM Gateway primarily for key tracking. Since we have agents, I need to know which agent is using which key and how much cost it is consuming per each message. LLM Gateway helps me manage the keys, store the keys, and save them, and it also provides an analytical dashboard with spend logs showing how much each agent is costing, what model it is using, and everything related to it..”

Validated user[Read full review](#) 

Software Engineer at a consultancy with 11-50 employees

“My main use case for LLM Gateway is that as new AI use cases emerge, such as a new internal agent or a customer-facing assistant, teams do not start from scratch; they simply plug into the gateway.

“One clear example of how my team has used LLM Gateway for one of those use cases is our internal AI assistant that helps operations and support teams get quick answers about orders, inventory, and internal processes. Every time that assistant makes a call to a language model, the request goes through the gateway, so we automatically capture which model was used, how long it took, how many tokens were consumed, and whether there were any errors. If a provider slows down, we can route traffic to a fallback model without changing application code, which saved us from scrambling during a couple of peak load situations..”

Shravan Revanna[Read full review](#) 

Software Engineer at klydo.in

“My main use case for LLM Gateway is building an agentic system, a harness wherein we can build multiple use cases that will be supported mainly for PDLC and SDLC automation.

“Whenever we want to use LLM Gateway for PDLC or SDLC automation, we want to create spec-to-code or code-to-spec, and we want to convert ideas into specifications.

“Whenever we want to create any documentation or any features or epics from converting from code to spec-to-code using LLM Gateway, we need to call multiple LLMs, and we want some intermediate gateway wherein it will handle our authentication, authorization, as well as the cost optimizations can be seen. For that purpose, we have used LLM Gateway. Some of the use cases need multi-modal calls wherein we can use multiple models at the same time, so LLM Gateway is a valuable gateway to work with..”

Validated user

[Read full review](#) 

Senior Architect at a tech vendor with 10,001+ employees

“I am currently evaluating the implementation of LLM Gateway on our agency environment. I have extensive experience with LLM Gateway and Guardrails, and it has become my primary focus at work.

“We are using LLM Gateway for our agentic workflows, which encompasses most of our current operations.

“We use this gateway for LLM proxies, primarily leveraging the AI Guardrails functionalities. We are implementing a comprehensive set of controls and a full verification layer for our API calls. We hire vendors such as Anthropic or OpenAI and import their keys into LLM Gateway. When we make this technology available to employees who need to use Cloud code, they access it through the LLM Gateway API key. When you call Cloud code using any prompt, that API call instantly passes through our LLM Gateway with all our Guardrails applied. This is the current workflow we are using and applying across the entire company..”

Guilherme Ferreira Mury

Senior Penetration Tester at a wholesaler/distributor with 501-1,000 employees

[Read full review](#) 

“I have been working as a Decision Scientist at Mu Sigma for around four years and have been using LLM Gateway for two years. Since I created a chatbot using LLM, we use different models to deploy, and since we are using different models, we need LLM Gateway to integrate into the particular chatbot.

“One example from my work experience is using LLM Gateway as a single entry point for multiple AI models. My chatbot sends the user prompt to the gateway, which handles authentication, routing to the appropriate LLM, logging, rate limiting, and monitoring. The gateway then returns the response to the chatbot. This setup makes it easier to switch models and manage usage without changing the chatbot's core application.

“Beyond basic request routing, I use LLM Gateway for centralized API management across different AI models. It provides consistent authentication, rate limiting, logging, monitoring, and fallback routing if one model is unavailable. This makes the chatbot more reliable, easier to maintain, and allows us to switch or compare models without changing the application logic. The main use case that we are using LLM Gateway for in the current scenario is centralized API management along with authentication and other related factors..”

Dhanesan Sridhar

Decision Scientist 3 at Mu Sigma Inc.

[Read full review](#) 

“Our main use case for LLM Gateway is that our company has partnerships with multiple LLM providers including OpenAI, Claude, and Gemini. LLM Gateway acts as an interface between all three providers. I would describe it as a router that functions as middleware between our application and the AI providers so that we do not need to give or share API keys to each team.

“Our team calls LLM Gateway from their application, and all the keys and routing configurations are present in LLM Gateway. Its responsibility is to connect with Claude, OpenAI, or Gemini based on the request we receive.

“We have an application in which users can ask anything. For example, if a user is asking a general question, we call LLM Gateway and pass the model name as ChatGPT. It internally uses ChatGPT itself. If the question is related to the application we created, it internally uses RAG and goes to Claude. LLM Gateway is responsible for redirecting the request based on context.

“LLM Gateway also has an additional feature where if one of the models is unavailable at a time, it automatically redirects the request to another model, so there is no downtime in the application. The automatic failover feature ensures that if one model is not available, LLM Gateway redirects the request to another model..”

Akashkhurana Hirana

Senior Software Engineer 2 at Porch

[Read full review](#) 

Setup

The setup process involves configuring and preparing the product or service for use, which may include tasks such as installation, account creation, initial configuration, and troubleshooting any issues that may arise. Below you can find real user quotes about the setup process.

“My experience with pricing and licensing has been positive. The licensing model is straightforward, and the setup cost was reasonable for the value it provides. While the initial implementation required more configuration, it reduced long-term operational effort by centralizing AI model management. I think the pricing is fair for enterprise use, although more transparent cost forecasting and usage-based pricing insights would make it even better..”

Dhanesan Sridhar

Decision Scientist 3 at Mu Sigma Inc.

[Read full review](#) 

“The setup was straightforward. We did not encounter any problems. We found an instance that could fulfill the basic requirements, installed the dependencies, and it was very easy to implement. It took around ten minutes. We just installed all the requirements, and the application was already up. The configuration is straightforward as well. You just have to connect a provider key, such as Anthropic, OpenAI, and providers like that. Then you can already start using it. You just have to generate your LLM Gateway key, and you can already use it..”

Guilherme Ferreira Mury[Read full review](#) 

Senior Penetration Tester at a wholesaler/distributor with 501-1,000 employees

“I usually start with the free tier, which is very good. For the enterprise version, LLM Gateway charges as other products do, but the setup time is quick, under a minute, with no cost for the free tier. After using LLM Gateway, we see that our security risks have reduced. In my organization, we do not only look at ROI; we also consider security threats. Since adopting LLM Gateway, the complexity of our projects has decreased, and the security concerns have lessened. I estimate it has saved us around 20–30% of our time, and around 30% sounds reasonable..”

Akashkhurana Hirana[Read full review](#) 

Senior Software Engineer 2 at Porch

Customer Service and Support

“The customer support and documentation for LLM Gateway are pretty good. Although the community is a bit sparse because of its newness, the available support is very effective. I rate the customer support a perfect 10..”

Akashkhurana Hirana

Senior Software Engineer 2 at Porch

[Read full review](#) 

“Our experience with customer support has been positive. The support team has been responsive, knowledgeable, and helpful in resolving technical issues and answering implementation questions. The documentation is also useful for common tasks, although I would like to see more advanced examples and troubleshooting guides for complex enterprise deployments..”

Dhanesan Sridhar

Decision Scientist 3 at Mu Sigma Inc.

[Read full review](#) 

“Customer support for LLM Gateway has been responsive and technical; when we had implementation questions early on, responses were quick and specific, not generic replies. Most issues did not require escalations because the documentation covered the basics, but when we did reach out, turnaround was solid. Ongoing, we have not needed much hand-holding, which is a good sign..”

Shravan Revanna

Software Engineer at klydo.in

[Read full review](#) 

Other Advice

“LLM Gateway does require a certain level of maintenance, but it is pretty much at the level of the Guardrails that you want to apply. The maintenance needed is primarily for improving the use of the gateway. I would rate this product a 9 out of 10..”

Guilherme Ferreira Mury

Senior Penetration Tester at a wholesaler/distributor with 501-1,000 employees

[Read full review](#) 

“I would advise new users that LLM Gateway provides better traceability of the models being used while maintaining security. It is secure, cost-efficient, and offers superior traceability. I would rate my overall experience with this product an 8 out of 10..”

Validated user

Software Engineer at a consultancy with 11-50 employees

[Read full review](#) 

“The advice I can give to others looking into using LLM Gateway is that it is very simple to use, but at the same time, you need to be very sure while creating the API keys that you are not sharing these API keys with any external applications. I find this process quite interesting, fast, and responsive. I rated this review a seven out of ten..”

Validated user

Senior Architect at a tech vendor with 10,001+ employees

[Read full review](#) 

“The accuracy of LLM Gateway's output is quite good. If one model is down, it automatically redirects requests to another model, which is a very beneficial feature. My advice for others looking into using LLM Gateway is to start with it. It takes very little time to set up and has a user-friendly dashboard that displays model usage. You can also set thresholds, specifying the number of tokens or costs for each model, which is very convenient. Depending on the product size, since it is new in the market, our usage has been satisfactory. I have given this review a rating of 9 out of 10..”

Akashkhurana Hirana

Senior Software Engineer 2 at Porch

[Read full review](#) 

“My advice for others looking into using LLM Gateway is to start with a clear use case and onboard one or two services first. It is important to get logging, cost views, and fallbacks wired in early, then bake it into your default service template so teams do not bypass it. Do not over-rotate on exotic routing on day one; establish visibility first and treat it as an enabling layer, not a silver bullet. Keep prompt quality, evaluations, and data governance as first-class concerns alongside

the gateway, not after.

“If you are scaling AI features across teams, centralization pays off. Start simple, instrument early, and allow the gateway to reduce toil while you focus on product value. I would rate my overall experience with LLM Gateway as an eight out of ten..”

Shravan Revanna

Software Engineer at klydo.in

[Read full review](#) 

“I would rate the accuracy and reliability of the output highly. The quality mainly depends on the underlying language model, but LLM Gateway improves overall reliability through consistent request handling, model routing, retries, and failover. In my experience, responses have been stable and dependable, and the gateway helps maintain service continuity even when a provider has issues. Overall, it is a reliable platform for running production AI applications.

“My advice would be to start with a clear understanding of your AI use case and integration requirements. Take advantage of LLM Gateway's centralized API management, security, logging, and monitoring features from the beginning, as they make scaling much easier. Also, spend time setting up governance, access control, and observability early in the project. Finally, test different LLM providers through the gateway to find the best balance of performance, cost, and accuracy for your workloads. I would rate this product a 9 out of 10..”

About PeerSpot

PeerSpot is the leading review site for cloud, AI, and business software. We created PeerSpot to provide a trusted platform to share information about software, applications, and services. Since 2012, over 22 million people have used PeerSpot to choose the right software for their business.

PeerSpot helps tech professionals by providing:

- A list of products recommended by real users
- In-depth reviews, including pros and cons
- Specific information to help you choose the best vendor for your needs

Use PeerSpot to:

- Read and post reviews of products
- Access over 30,000 buyer's guides and comparison reports
- Request or share information about functionality, quality, and pricing

Join PeerSpot to connect with peers to help you:

- Get immediate answers to questions
- Validate vendor claims
- Exchange tips for getting the best deals with vendor
