Product Recap

Docker on CentOS

Docker on CentOS Recap

Docker on CentOS enhances deployment with container isolation, image-based packaging, and environment portability. Users experience streamlined application deployment and rapid releases, benefiting scalability and market agility despite some challenges from its deprecated status.

Docker on CentOS supports building, packaging, and running containerized applications on Linux servers. DevOps teams employ it for managing container infrastructure and CI/CD pipelines. Key uses include web hosting, backend service management, and development of Node.js microservices, APIs, and NGINX services. It addresses deployment efficiency, although orchestration and lifecycle management require Kubernetes. Security improvements and stronger OS update integration are areas of interest.

What are the most important features of Docker on CentOS?

- **Container Isolation:** Separates applications for security and stability.
- **Image-based Packaging:** Ensures consistent application environments.
- **Environment Portability:** Enhances application deployment across platforms.
- **Lightweight Containers:** Improves scalability with faster startup times.
- **Accessible Docker Repository:** Simplifies application deployment.

What benefits or ROI should users look for?

- **Faster Releases:** Reduces time to market with quicker deployment.
- **Resource Efficiency:** Utilizes system resources effectively.
- **Reduced Inconsistencies:** Minimizes environment differences in deployments.
- **Reliable File System:** Provides stable application runtime.

Industries utilize Docker on CentOS for proof of concept development, machine learning, website hosting, and microfinance application development. It is pivotal in CI/CD processes, supporting robust container infrastructure for comprehensive DevOps and platform team tasks. Its application in diverse environments showcases the adaptability of containerized solutions.

Valuable Features

Excerpts from real customer reviews on PeerSpot:

“Docker on CentOS, being lightweight and stable, integrates well with the Linux kernel, providing minimum overhead and cost efficiency, which is crucial for resource-constrained environments.”

VijaySoundaram

Senior Software Engineer at Charter Communications

“Automation became easier to maintain, performance results became more trustworthy, and at the end of the day, the team spent less time fixing environment issues and more time improving test coverage and product quality.”

IsaacHernandez

Senior Technical Lead QA at a computer software company with 501-1,000 employees

“When Docker on CentOS is implemented properly in my organization, the benefits have measurable real-world outcomes.”

Ailesanmi Hilesome

Snr Linux Administrator

- ✓ “Overall, Docker on CentOS is a mature, reliable, and cost-effective platform that with good security practices, automation, and monitoring can significantly improve application deployment consistency and operational efficiency.”

Ebenezer Gbormittah

Devops Engineer at GMPE Technologies Group Inc.

- ✓ “Docker on CentOS has impacted our organization positively by enabling them to use their existing infrastructure and their policies while also moving towards modernized architecture, and their uptime increased up to 99.99% with applications no longer experiencing any downtime due to customer flow or user flow.”

Zakaullah Khan

Software Development Manager at Superior Information System

- ✓ “Docker on CentOS has positively impacted my organization because, deployment speed-wise, it is similar to other CentOS apps, but Docker is user-friendly.”

JayaganeshK

Senior Engineer at a tech consulting company with 501-1,000 employees

“This approach is saving us cost and also saving us a significant amount of time.”

G Srivastava

Senior Cloud Engineer at a tech services company with 201-500 employees

What users had to say about valuable features:

“The features I find especially valuable about how Docker on CentOS works include decoupling your architecture from your physical machines and your applications. You can run one application with a different tech stack version and the same application on the same machine with a different tech stack version. For example, you can have an application with Laravel version 9 or 8 and another application developed for ASP.net. You can deploy both on the same machine without having to configure them and without those two environments interacting and conflicting with each other. That is the best thing that Docker on CentOS does, and it does it everywhere, even in CentOS..”

Zakaullah Khan

Software Development Manager at Superior Information System

[Read full review](#)

“The best features offered by Docker on CentOS are that it's rather easy to set up. Docker is quite easy to set up, pretty simple to restart, and when I need to create new use cases, it's pretty simple to set up, stop, restart, and update.

“Among all these features, the fact that I can set it up easily seems the most valuable in my daily work. For example, with simple YAML code, it's pretty easy to do, rather quick, and rather secure..”

Validated user

[Read full review](#) 

Technicien Informatique at a manufacturing company with 10,001+ employees

“The best features Docker on CentOS offers include cleanup and management of the containers.

“When I mention cleanup and management, what specifically stands out for me is the ease of removing unused containers or any dangling resources such as the volume that is created with it or even the network adapters or even logs.

“Docker on CentOS has positively impacted my organization as it has been serving us very well until we reduced our footprint on the container side moving to Alpine, but meanwhile, it has been serving us well. It has been serving us in terms of stability and reliability. The service is easy to start, stop, and work with..”

Validated user

[Read full review](#) 

devops at a outsourcing company with 1,001-5,000 employees

“In my experience, the best features Docker on CentOS offers are images flavor, Docker Hub, and building images.

Docker Hub helps my workflow and development process by being used for image sharing, and we use default images from famous vendors to get direct Docker images to build and in-build our application.

Docker on CentOS has positively impacted my organization by making big data easy to configure and deploy, and it provides a more secure and isolated environment. However, from my personal perspective, you lose to Podman, which is even more secure in terms of environments and CHROOT approach for containerization.

Docker on CentOS has improved my team's workflow and productivity with quick spin up, cluster arrangement, and load balancing making better improvements amongst our internal Kafka cluster..”

Iakym Lynnyk

Platform Engineer at Team Rockstars IT

[Read full review](#) 

“The best features Docker on CentOS offers in my experience are that we can easily get updates and because it is free, we can easily mitigate issues from our end if we have the expertise in CentOS and Docker, which can be managed internally. The best part is that you don't need to pay anyone; it is free, and we can develop the environment and manage it according to our expertise.

I would add that it is very easy to manage Docker on CentOS, and this is the best part for me.

Docker on CentOS has impacted my organization positively by being cost-effective. The main thing is the cost-effectiveness because we don't need to pay anyone.

I can tell you more about the cost-effectiveness. I have noticed that we don't need to purchase the operating system, and we also don't need to purchase any kind of license for Docker because both are free..”

Rajesh Pant

Sr. Lead Infrastructure at Kyndryl

[Read full review](#) 

“Using Docker on CentOS has specifically helped me manage incoming calls and match records through ease of scalability and ease of troubleshooting. In terms of reliability and vertical or horizontal scaling, it is much easier when using containers, and making changes that are specific to a certain element is easier than bringing down the whole infrastructure, so I find that troubleshooting failure is also easier.

“Docker on CentOS has positively impacted my organization by saving time and reducing costs in terms of manpower. We do not require as many engineers because Docker gives you infrastructure as code through our cloud platform. Now that you can easily maintain infrastructure as code, you find that you do not need maybe ten plus engineers to manage complex platforms across multiple markets.

“The time to recover was almost cut in half when we started simplifying this using microservices. We noticed that we can do a lot more in terms of reporting because databases would be quite heavier in production and impact bare metal VMs. This vertical and horizontal scale that is automated helped us, and even when someone is running a report, there is business continuity. We saw that the incidents that were raised because of lack of system resources during heavy reporting was almost cut by half, moving from thirteen incidents to only one incident a week.

“Going from thirteen incidents a week down to one was mainly due to going the microservices way, and then also splitting the underlying workload, splitting more of a reporting workload from live platforms..”

George Muddu

Global Manager, Information Technology Engineering at a tech vendor with 1,001-5,000 employees

[Read full review](#) 

Other Solutions Considered

“Before Docker on CentOS, we were using VMs entirely and bare metals. When we switched to microservices, it is quite much better in terms of scaling and horizontal and vertical scaling..”

George Muddu

Global Manager, Information Technology Engineering at a tech vendor with 1,001-5,000 employees

[Read full review](#) 

“The previous situation before Docker on CentOS was that they wanted to have a containerization solution in place to easily scale their architecture as effectively as possible, as their infrastructure needed to be self-healing. We needed to move on to Docker on CentOS. There wasn't any other alternative used at that time..”

Zakaullah Khan

Software Development Manager at Superior Information System

[Read full review](#) 

“I previously used a different solution before Docker on CentOS, but the solution was switched together with the company, and I never chose such technology. I was adapting to them and did not have a preference for the technology, but earlier I used the most early container solutions..”

Iakym Lynnyk

Platform Engineer at Team Rockstars IT

[Read full review](#) 

Before choosing Docker on CentOS, we evaluated options including virtual machines and manually configured setups.

Other options we evaluated included Jenkins, manually configured CI/CD agents, and manual Kubernetes. .”

IsaacHernandez

Senior Technical Lead QA at a computer software company with 501-1,000 employees

[Read full review](#) 

“I evaluated other options before choosing Docker on CentOS, including Debian, Ubuntu itself, and FreeDOS. However, CentOS was easier to integrate and more useful when using WHM and cPanel..”

Alex All

Software Developer at Marra Moncks Informatica

[Read full review](#) 

“Before choosing Docker on CentOS, we did evaluate other options. Ubuntu was one of the options evaluated, which was also related, but it wasn't according to the requirements for organization policies and procedures. The setup would have been easy, but the organization policies regarding using Ubuntu were quite strict, so we had to drop that and keep using Docker on CentOS..”

Zakaullah Khan

Software Development Manager at Superior Information System

[Read full review](#) 

ROI

Real user quotes about their ROI:

“I have seen a return on investment as I save money and time because I can run many DB2 applications in the same virtual machine, so I don't need any extra machines..”

Ramazan Cetinkaya

System Software Support Engineer at a tech vendor with 11-50 employees

[Read full review](#) 

“I have seen a return on investment; I built my own AI agents connected to my Proxmox server, which led to significant improvements in time and money saved, amounting to over 60%..”

Alex All

Software Developer at Marra Moncks Informatica

[Read full review](#) 

“I have seen a return on investment with Docker on CentOS; time is the major factor here. In our case, it was quite easy to use it and deploy it, so that is one of the main things that we observed..”

Validated user

[Read full review](#) 

Software Engineer at a outsourcing company with 201-500 employees

“I have seen a return on investment regarding Docker on CentOS. The development time from operation to deploying from operation to development and the response time from the team has been quite reduced. A team of five is now able to manage the whole orchestration, the development, and the DevOps completely, which improved the delivery process. Previously, the infrastructure team had to intervene quite regularly to spin up VMs. Now, with the development team alone, we can get the job done very quickly, easily, fluently, and effectively..”

Zakaullah Khan

[Read full review](#) 

Software Development Manager at Superior Information System

“We observed a positive return on investment after adopting Docker on CentOS. While Docker on CentOS didn't necessarily reduce the number of employees, it significantly improved team productivity and operational efficiency. Some measurable improvements include a reduction in deployment time from forty-five to sixty minutes to under ten minutes, representing an eighty to eighty-five percent reduction. Environment-related issues dropped by approximately eighty percent as the same Docker image was used consistently across all environments. Recovery time during failed deployments improved from about thirty minutes to less than five minutes by rolling back to a previous image. Infrastructure utilization increased by around thirty to forty percent since multiple containers could efficiently share resources..”

Ebenezer Gbormittah

Devops Engineer at GMPE Technologies Group Inc.

[Read full review](#) 

For example, in one project, we saw several positive and measurable outcomes, especially around test execution stability and environment consistency. One major improvement was reducing the time spent preparing and fixing test environments. Before Docker on CentOS, a lot of time was lost because different machines had different versions of Node.js. After containerizing the test execution, the setup became much more predictable because the same Docker image was used across local, staging, and CI environments. In terms of outcomes, we saw improvements such as less troubleshooting time, faster onboarding, more stable automation, better parallel execution, and cleaner CI/CD execution logs. We now have logs, reports, and artifacts that are easier to collect from each container. A practical example is the regression testing, where previously, when a test failed, the team often had to check whether the problem came from the application, the server, the browser version, or the local configuration. With Docker on CentOS, we had a standardized execution layer that reduced false failures and made debugging faster. From a performance control perspective, Docker on CentOS also helped avoid overloading the host server by defining memory and CPU limits, allowing us to better understand whether a slow execution was caused by the application, the test framework, or the infrastructure. This made performance results more reliable.

IsaacHernandez

Senior Technical Lead QA at a computer software company with 501-1,000 employees

[Read full review](#) 

Use Case

“I mainly use Docker on CentOS on my NAS, and on my NAS I use it to deploy several different applications, such as monitoring how my NAS is running, handling downloads, and monitoring my NAS..”

Validated user

Technicien Informatique at a manufacturing company with 10,001+ employees

[Read full review](#) 

“My main use case for Docker on CentOS is economizing. First, we were having to spin up a PBX mainly, and when using Asterisk, instead of creating a full dedicated server for this, I would use Docker to spin up the Asterisk that then easily integrates the Asterisk user cases, especially a customer calling us with our Django and API. Docker containers allow us to match the incoming call with the record so that we know who is calling us, at what time, and using which phone number so that we can create an omnichannel..”

George Muddu

Global Manager, Information Technology Engineering at a tech vendor with 1,001-5,000 employees

[Read full review](#) 

“My main use case for Docker on CentOS is in my DevOps environment where multiple websites and multiple databases are running.

A specific example of how I use Docker on CentOS in my DevOps environment is that we have multiple containers running; one container is for the app, one is for the database, and one is for the platform. Combined together, my complete website is working on this.

I don't have anything unique to add about my use case for Docker on CentOS because every organization is working on the same thing, meaning they have their own environment where their proxy is running, their database is running, and their monitoring is running, all combined together..”

Rajesh Pant

Sr. Lead Infrastructure at Kyndryl

[Read full review](#) 

“My main use case for Docker on CentOS involves various workloads that are all interconnected on ECS and they were initially running on Docker. All of them are running on Docker as a matter of fact, but they were initially running on CentOS.

“A quick specific example of one of those workloads, or how I'm using Docker on CentOS in my environment, is that it is no longer the case as we moved to Alpine on ECS, but historically it has been running on EC2 instances and Docker was running the various workloads containers for our application on the box itself..”

Validated user

[Read full review](#) 

devops at a outsourcing company with 1,001-5,000 employees

“Docker on CentOS is the best utility for development, and I have no experience with Docker Swarm. We are developing our internal applications that are intended to run in Kubernetes in Docker.

An application where Docker on CentOS plays a key role is as a container manager.

Applications are running in Kubernetes, and Docker on CentOS is a development environment.

Docker on CentOS is an option for containerization and is the approach to consider before going to Kubernetes or more major automating containerization systems..”

Iakym Lynnyk

Platform Engineer at Team Rockstars IT

[Read full review](#) 

“My main use case for Docker on CentOS was to bridge the gap between moving from monolith architecture to self-healing architecture. The team used Docker on CentOS to transition from monolith towards a self-healing approach.

The team was running CentOS on their platform in their data center and they were using monolith architecture. They had plenty of applications running for different businesses in different departments. The problem was that they were working under the strategy that if it works, don't touch it. Some of their applications were running on different tech stack versions on VMs in VMware. The problem was that whenever they had to scale, they had to spin up a complete VM to accommodate the workload. This was quite daunting and if the application had certain problems, the whole process was very resource intensive. We suggested them to use self-healing architecture such as Kubernetes, but that was a huge shift for them. We introduced them to containerization through Docker on CentOS. We started by creating containers out of all the applications so that the whole environment, the version, and everything could be decoupled from the CentOS operating system and the VMs. With the deployment of Docker on CentOS, they could scale according to their work very easily and fast, and they gained hands-on experience with containerization. Once that was done, we used the images to move to Kubernetes. That transition was a huge task as they were seeing quite new tools and networking. Docker on CentOS served as a bridge between monolith and self-healing architecture..”

Zakaullah Khan

Software Development Manager at Superior Information System

[Read full review](#) 

Setup

The setup process involves configuring and preparing the product or service for use, which may include tasks such as installation, account creation, initial configuration, and troubleshooting any issues that may arise. Below you can find real user quotes about the setup process.

“I am able to create a database container with Docker on CentOS in minutes. If I want to create a testing environment, the time is approximately one day..”

Luisfernando Benavides

Software Engineer at MERCADOLIBRE COLOMBIA

[Read full review](#) 

“My advice to others looking into using Docker on CentOS is that they should read carefully the documentation, and they should have done everything right on first installation..”

Ramazan Cetinkaya

System Software Support Engineer at a tech vendor with 11-50 employees

[Read full review](#) 

“My experience with the learning curve for Docker on CentOS was that the setup process was quite quirky. Otherwise, the rest of the team found it quite smooth. The initial setup was similar to other setups but there was quite a bit of friction. However, that friction was worth it for the final outcome..”

Zakaullah Khan

[Read full review](#) 

Software Development Manager at Superior Information System

“My experience with Docker on CentOS is that it is cost-effective and relatively inexpensive to set up. Docker on CentOS engine itself is open-source, so there is no license cost for the container runtime we use on our CentOS server. Our primary expenses are related to the underlying infrastructure, such as virtual machines, cloud instances, storage, networking, and monitoring tools, not Docker on CentOS itself. The initial setup cost was low; installing Docker on CentOS took less than an hour, and once the base configuration, security settings, and CI/CD integration were in place, additional applications could be deployed quickly with minimal effort..”

Ebenezer Gbormittah

[Read full review](#) 

Devops Engineer at GMPE Technologies Group Inc.

For our private or hybrid deployments, we use various cloud providers, including AWS, Google Cloud, and Azure. My experience with pricing, setup cost, and licensing has generally been positive. The initial setup cost was more related to infrastructure, configuration, and monitoring. Once the Docker images and pipelines were standardized, the long-term costs became easier to manage because we spent less time fixing environment issues and more time executing tests. From a licensing perspective, Docker Engine on Linux is licensed under Apache, while Docker Desktop has a separate subscription. Overall, I would say that the pricing and licensing experience is reasonable, but it requires good governance to clarify the distinction between server-side Docker Engine usage and Docker Desktop usage, track who needs paid subscriptions, and include cloud compute, storage, networking, image registry, and monitoring costs.

IsaacHernandez

[Read full review](#) 

Senior Technical Lead QA at a computer software company with 501-1,000 employees

“The steps I needed to take when setting the solution up involved starting with dockerizing the application on CentOS, primarily with versions 7/8. I pulled the Docker image after setting up CentOS and created user groups to prevent overwriting. Using the daemon setup, I configured the firewall and created the Docker file. My workflow continued with using Maven version 3.8 and integrating it with Eclipse to enhance several endpoints. This included updating PL/SQL procedures and aiming for an SLA of less than one second, with a multi-stage deployment reflecting the expanding functionality of our application.

“From my perspective, the experience with the deployment of Docker on CentOS is quite positive, especially for the CI/CD pipeline. The installation is straightforward with easy updates and configurations, including starting Docker groups and handling the daemon without challenges. I utilized a JSON-based setup, firewall setups were simple, and the multi-stage deployments were effective. My integration efforts with Maven and Eclipse were also seamless, leading to a flawless push to ECR..”

Customer Service and Support

“Customer support for Docker on CentOS is good. Whenever we are stuck, we get customer support easily. On a scale of 1 to 10, I think overall customer support for Docker on CentOS is good..”

Validated user

Software Engineer at a outsourcing company with 201-500 employees

[Read full review](#) 

“For customer support for Docker on CentOS, I do not reach out. We always use the community of Docker and the Linux community or the CentOS community, which gives reliable information. Professional support is not needed since everything we do is in-house..”

George Muddu

Global Manager, Information Technology Engineering at a tech vendor with 1,001-5,000 employees

[Read full review](#) 

“Customer support for Docker on CentOS is not available for us since we use the community version, which is free. We don't have any support because we don't use the enterprise version, so I cannot comment on what support is available at the enterprise level..”

Rajesh Pant

Sr. Lead Infrastructure at Kyndryl

[Read full review](#) 

“The customer support for Docker on CentOS is excellent, as there are very good community forums. Whenever we run into issues, we can turn to these forums, where we can easily find solutions by pasting the errors we receive. Many tech experts have contributed to the forum, making it easy for us to get help..”

JayaganeshK

Senior Engineer at a tech consulting company with 501-1,000 employees

[Read full review](#) 

“My customer support is automated by AI; therefore, I don't have specific feedback about support teams related to CentOS.

“I have never needed help from support teams; I find the documentation very well formulated and easier to implement..”

Alex All

Software Developer at Marra Moncks Informatica

[Read full review](#) 

“I do not often communicate with the technical support of Docker on CentOS, as I haven't found the need; the documentation has been sufficient.

“The documentation for Docker on CentOS is excellent; I find answers to my questions regarding the Docker daemon and network configuration issues quickly and efficiently. The information available for storage and security has been helpful, despite some challenges in those areas along with conducting DR exercises..”

VijaySoundaram

Senior Software Engineer at Charter Communications

[Read full review](#) 

Other Advice

“On a scale of one to ten, I would rate Docker on CentOS overall as a seven. I chose seven because I deducted three points because of the RCA part.

Regarding Docker on CentOS's AI capabilities, security is the most important part of any organization these days. Honestly, I haven't used the AI capabilities or AI part on CentOS till now; once I do, only then I can suggest anything on that.

When it comes to Docker on CentOS's AI capabilities, I haven't used it, so I am not the right person to answer about its accuracy and reliability of output at this time.

My advice for others looking into using Docker on CentOS is that they must check if any enterprise-level support is available. My overall rating for this product is seven..”

Rajesh Pant

Sr. Lead Infrastructure at Kyndryl

[Read full review](#) 

“My advice to others looking into using Docker on CentOS is to do it. It is a good product. I would rate Docker on CentOS a nine out of ten.

“I gave it a nine out of ten because no one is perfect.

“Regarding Docker on CentOS's AI capabilities, it looks pretty much equal to the other operating systems that are running Docker. I do not have much experience on that side which would differ from the other operating systems, but I will presume it is in fact well guarded. I have not played with its accuracy and reliability of output.

“My overall review rating for Docker on CentOS is nine out of ten..”

Validated user

devops at a outsourcing company with 1,001-5,000 employees

[Read full review](#) 

“Docker on CentOS has positively impacted my organization by making big data easy to configure and deploy, and it provides a more secure and isolated environment. However, from my personal perspective, you lose to Podman, which is even more secure in terms of environments and CHROOT approach for containerization.

If Docker on CentOS is seven, then Podman is eight, and Kubernetes is ten.

I would say do not stick to [CentOS](#); I understand it is because of [AWS](#), but Docker and Linux work everywhere similarly.

“My advice for others looking into using Docker on CentOS is to implement it well with [Rancher](#)..”

Iakym Lynnyk

Platform Engineer at Team Rockstars IT

[Read full review](#) 

“My advice is to start with a solid foundation and follow container best practices from the beginning. First, use official and minimal base images to reduce the attack surface and improve performance. Keep both the CentOS host and Docker engine updated with the latest security patches. Second, avoid running containers as root users; use the principle of least privilege, enable SELinux, and scan container images regularly for vulnerabilities before deploying them to production. Third, automate your deployments by integrating Docker on CentOS with CI/CD pipelines. This ensures consistent builds, automated testing, and reliable deployment while reducing manual errors. I also recommend using Docker volumes for persistent data, custom networks for secure communication between services, and health checks, so failed containers can be detected and restarted automatically. Finally, start with a small proof of concept, document your Docker files and deployment process, monitor your containers using logging and metrics, and then scale gradually as your team gains experience. Overall, Docker on CentOS is a mature, reliable, and cost-effective platform. With good security practices, automation, and monitoring, it can significantly improve application deployment consistency and operational efficiency. I would rate my overall experience with this solution a nine out of ten..”

Ebenezer Gbormittah

Devops Engineer at GMPE Technologies Group Inc.

[Read full review](#) 

“I am migrating workloads from CentOS to another Linux flavor. Regarding the libraries and the security aspect, nothing to add apart from that it is end of life and I am quite behind schedule of migrating these workloads away from CentOS. I would trust the repository updates from CentOS, given that most of these would be tested before they are taken to Red Hat. Apart from the migration from end of life, there is a huge risk that I am seeing, but there is nothing else I can add.

“Regarding Docker on CentOS's AI capabilities, I cannot provide expertise as I am not a security expert. I trust the updates from the Docker repository and

everything that has been updated, and I would say that I trust the platform as Docker.

“My advice to others looking into using Docker on CentOS is that since Docker is still supported and growing and the community is good, it is a great product. For CentOS, either move to [Rocky Linux](#) or move to [Debian](#).

“I rate Docker on CentOS an eight out of ten..”

George Muddu

Global Manager, Information Technology Engineering at a tech vendor with 1,001-5,000 employees

[Read full review](#) 

“In my experience with Docker on CentOS, once it has been configured properly, what it does best is containerization; it is very smooth and effective.

Regarding Docker on CentOS's AI capabilities, I feel there are governance considerations on the CentOS right now, but I would really appreciate the opportunity to experiment with that. I haven't tried those AI features with Docker on CentOS right now.

Docker on CentOS is deployed in our organization as a kind of private cloud. The team owns its entity. They had their own complete infrastructure with data center infrastructure and VMware setup.

Docker on CentOS has affected my team's productivity and collaboration positively. Docker on CentOS integrates with all the tools and workflows quite seamlessly. Once deployed and started working, it is quite smooth. The whole repository that was set up can be published to the Docker on CentOS repository and Docker on CentOS accesses the repository very smoothly.

Docker on CentOS supports compliance and regulatory requirements in our organization by shifting to a self-healing architecture. They were first aware that

Docker on CentOS would be used as a reliable containerization industry standard. That was completely on-premises and the repositories could be handled that way. One thing that we couldn't use with Docker on CentOS is the public repository. Docker on CentOS enabled us to set up local repositories. That way Docker on CentOS helps us align with the organization's infrastructure policies, and they receive their updates into the system without relying on public repositories. We needed to set up local repositories for all the images in our organization setup using Docker on CentOS.

My advice for others looking into using Docker on CentOS is to be ready for the friction. SELinux policies and everything can be a bit difficult, but once it gets running, you get the best of both worlds from the security point of view. Keep in mind that your first startup could be hard, but the outcome will be very good. I have no additional thoughts about Docker on CentOS. I would rate this solution a 10 out of 10..”

About PeerSpot

PeerSpot is the leading review site for cloud, AI, and business software. We created PeerSpot to provide a trusted platform to share information about software, applications, and services. Since 2012, over 22 million people have used PeerSpot to choose the right software for their business.

PeerSpot helps tech professionals by providing:

- A list of products recommended by real users
- In-depth reviews, including pros and cons
- Specific information to help you choose the best vendor for your needs

Use PeerSpot to:

- Read and post reviews of products
- Access over 30,000 buyer's guides and comparison reports
- Request or share information about functionality, quality, and pricing

Join PeerSpot to connect with peers to help you:

- Get immediate answers to questions
- Validate vendor claims
- Exchange tips for getting the best deals with vendor
